62.85 1948 GLADIOLUS
Exhibitors and Hybridists Handbook

**DIADEM** Wonderful new fragrant gladiolus.

## Nuttall's Gladview Gardens R. D. NO. 2 PROVO, UTAH

W. REED NUTTALL, July 24, 1947.

The Centennial beard grew almost as well as the glads.

GLADIOLUS VARIETIES are listed in the following sections of this catalog. The titles of the sections are self explanatory, however, as many varieties qualify under more than one heading, ie., Crinkles is an "Old Timer," a "Famous Parent" and a "Prize Winner;" to save duplication they will be listed under but one heading with an explanation of the other qualities being mentioned in the description.

SECTION I  New Introductions	age
SECTION II	0
Large flowered prize winners	
Famous parents	29
SECTION IV Other large flowered standard and novelty varieties	33
SECTION V Small flowered winners	
Other good baby glads	38
Famous old timers	39

## 1948 GLADIOLUS

# Exhibitors and Hybridists HANDBOOK

## Nuttall's Gladview Gardens

R. F. D. 2, Provo, Utah

#### Dear Glad Fans:

It is with pleasure that we send you our 1948 Handbook of Gladiolus prices and information. Many thanks for the fine orders of last season and for the expressions and compliments on our service and the quality of our bulbs. Your letters have furnished the inspiration needed to show us the way for additional features and services for 1948.

#### Visitors are Welcome

We extend a hearty welcome to visitors, not only to our gladiolus fields, but to our beautiful State as well. Utah, in the heart of the Rockies, is the central point for visitors to our beautiful Western National Parks and Monuments, namely: Zions, Bryces, Grand Canyon, Yellowstone, Arches, Natural Bridges, Dinosaur, Cedar Breaks, Capitol Reefs, Timpanogos Cave, and others. We hope many of you will be induced to travel in Utah this summer.

Late last autumn we were able to purchase a new and much larger place, so this summer our fields will be situated just two miles southeast of Provo, approximately two blocks east of Springville Road (Highway 91) on 13th South Street. Right at the foot of the lofty Wasatch Mountains. Make it a point to come and see them. The complete planting consists of over 1500 named varieties and many seedlings. They will be in bloom during July, August and September.

### Join a Gladiolus Society

The New England Gladiolus Society is the oldest and largest Gladiolus Society on the Continent, has many departmental activities, and worldwide membership of over 6000. Each year they publish "The Gladiolus" containing numerous articles, many written especially for the Backyard Gardener, on gladiolus care, culture. selection of varieties, hybridizing, etc. This is a deluxe, flexible, imitation leather bound, illustrated book for your library. The society also publishes, each year, six issues of the "Gladiolus Magazine," containing timely hints and all the latest about glads. For only \$2 you get both the book and six issues of the magazine. Send to A. N. Drake, Secretary N.E.G.S., Horticultural Hall, Boston 15, Mass. (Note: Members of the Utah Gladiolus Society groups may receive membership for \$1.50 if they apply thru one of the Secretaries of our local Utah Groups; P. W. Carroll, RFD 2, Orem, Utah, (Secretary of the Wasatch Gladiolus Society) or Blaine Boudrero, 175 N. 1st West, Logan, Utah, (of the Bonneville Gladiolus Society) or Wesley Smith, 1041 South 8th West Street, Salt Lake City, Utah.)

Three years ago another group of Gladiolus growers started the North American Gladiolus Council. For \$1 sent to Alfons Bazdorf, Lincoln Park, New Jersey (Membership Secretary), you will receive four fine quarterly

bulletins filled with the best gladiolus information.

Most states, some cities, counties, etc., also have active gladiolus societies. We will gladly help you get in touch with the society in your locality.

The Utah Gladiolus Society now consists of three associated groups: The Bonneville Gladiolus Society for Northern Utah and Southern Idaho, the Salt Lake Gladiolus Society for the area near Salt Lake City and the Wasatch Gladiolus Society for the south end of the State. These three groups work together and membership in one entitles one to full mem-

ber privileges in all three. Each group will hold a show this summer and each holds regular meetings. Dues are \$1.50 and includes affiliate membership in the NAGC as well, which means that each member will also get the NAGC Quarterly Bulletins. For \$3.00 you may get the combination of NEGS, NAGC and Utah G. S. memberships, which will bring about the finest current gladiolus information printed, membership privileges, etc., and at a saving of \$1.00. Utah Secretaries are listed in the noteat the beginning of this heading.

JOIN A GLADIOLUS SOCIETY

## Remarks

We are probably the only growers who make a definite effort to list all top winners and believe we list the most complete list of current winners offered by anyone in the U. S. A.

On the show table Picardy has been at the top for almost fifteen years, but is finally giving ground to a few other varieties that are equally as good or better when well grown. Some of these are: Algonquin, Burma, Corona, Eglantine, Elizabeth the Queen, Leading Lady, Margaret Beaton, Red Charm, Silver Wings, Spotlight, Summer Gal, White Gold, and a few others. When stocks of these are more widely distributed, their winnings will be much greater. It should be understood that winnings of the newer varieties are few because their newness and higher price has prevented their being grown and entered in very many shows. A safe rule to follow is: Any variety costing over 25c that is able to win 5 awards or more is as good or better than cheaper varieties winning many prizes. Also a variety that can win firsts and championships in shows all over the

continent is bound to be good in your own garden.

Using the NEGS and other reliable reports of the major shows held in 1946 and 1947 and tabulating only first prizes we find that over 280 varieties were able to win 5 or more awards. Most of these are listed in this catalog. The variety name is preceded by the number of prizes won.

Because in a few cases two or more-varieties have been given the same-name and in at least two cases a variety is listed under more than one-name, also to aid those interested infollowing up work of certain breeders and various other reasons we are listing the originator's name. In afew cases where the originator's name was unknown, we have inserted the name of the introducer or the country from which the variety was introduced. Originator's name follows the variety name.

Next comes the year of introduction. A candid opinion here may be of help: Because a variety is a few years old does not necessarily mean that it is inferior or outdated. Many

of the new expensive varieties are 20-29 definitely inferior to older varieties of the same color, and have been placed on the market only because they were somebody's baby or because the introducer was unacquainted with the fine varieties already on the market. As proof of the above, check the winnings of Crinkles, originated by Kundred and introduced in 1916; Minuet 1922, still mighty hard to beat; Mother Machree 1927, still winning plenty of prizes. There is a long list that would be longer if we were not so prone to discard the old in favor of the new. This does not mean that there are no good new glads, but merely that all new ones are not necessarily the best. Where competent judges are used, the ability to win is a very good criterion.

The National Classification Committee size and color class number, as used and recognized by most Gladiolus Societies in the U.S. and Canada, follows the date of introduction. In the shows, varieties compete in these color and size classes. Under this classification the 100 series includes the tiny miniatures with florets under 21/2 inches in diameter. The 200 series is for small glads with florets 2½ to 3¼ inches in diameter. The 300 class is for medium sized glads with florets of  $3\frac{1}{4}$  to  $4\frac{1}{4}$  inches. The 400 class is for large glads with florets of  $4\frac{1}{4}$  but under  $5\frac{1}{2}$  inches and the 500 class is for giants with florets 51/2 inches and over in diameter. The last two figures of this number indicate the color group to which the variety belongs. ending in even numbers have pure self colors or blend to lighter throats and those ending in odd numbers are marked with a deeper or contrasting These figures are based on shade. average growth under good culture.

00-09 Pure white to cream.

10-14 Light to deep yellow.

16-19 Light to deep buff.

20-29 Light to deep orange.

30-35 Light to deep salmon.

36-39 Shades of scarlet.

40-49 Light to deep pink.

50-59 Light red to black red.

60-65 Light to deep rose.

66-69 Lavender shades.

70-75 Purple shades.

76-79 Light to deep violet.

80-89 Smoky shades.

90-99 Any other color: greys, browns, greens, etc.

Most bulb growers supplying the retail trade use three bulb sizes. Large bulbs (indicated by Lge. in this catalog) are sorted so that the minimum is 11/4 inches in diameter; however, most are much larger. It usually takes two years to grow a bulb to this size from a bulblet, altho quite a large percentage of certain varieties under good culture will attain this size the first year. Bulbs three years old or over are no longer considered young bulbs. Medium (Med.) sized bulbs or yearlings as they are called in Australia and New Zealand, measure 3/4 to 11/4 inches in diameter. This size often makes almost as good bloom as the larger size but usually takes longer to bloom. Small bulbs (Sml.) or planting stock, are those measuring less than 3/4 of an inch in diameter. While this size often gives a fairly large percentage of bloom in certain varieties, they are usually much later, smaller and often not quite up to par in color. varieties often lack this quality in blooms from small bulbs. vantages of buying medium or small size bulbs are in the saving on the price as they usually sell for 25% to 75% less than large bulbs; then the smaller sizes usually produce more bulblets per bulb than larger sizes where the bulk of the bulb strength goes into producing a fine flower. The purchasing of yearling bulbs enables the bulb grower to furnish young vigorous bulbs of good size to

his customers the next year.

The color and size descriptions of most varieties are our impressions of the way the variety grows here in Utah. Blooming dates were tabulated for several years with the conclusion that they are not accurate enough to use in timing a variety for a future show date. Some varieties varied as much as three weeks in our variable Utah weather. Usually most varieties bloom in 80 to 100 days. frequently blooming in less than 80 days are designated as early and those taking much over 100 days as late. We are keeping records on the number of florets opening in the field, average height, health, propagation (Under this heading are experiments to determine whether bulblets of a variety germinate better planted the first or second spring after harvesting, whether bulblets need to be peeled, etc.) and other data. Tabulations may be complete enough to include some of this in our 1949 catalog.

## Parentages and Progeny

A leading feature of our catalog is the listing of the parents, known, and a partial list of the progeny of the more famous varieties. As will be realized, some varieties that are exceptional on the show bench may be good parents or may not. Also some varieties might be able to pass to their offspring fine qualities that are not apparent in their own makeup. It has been quite definitely proven by ivestock breeders and others that the ability and value of a parent is best proven by the records of the progeny of that parent. Or, as the Bible states, "By their fruits ye shall know them." Except for the few varieties that are the result of inbreeding or self crosses, we know that all glads have two parents, even tho one or both may be unknown and that a good glad may get most of its good qualities from but one of its parents. Also realizing that in all probability some of the new unproven varieties may be as good or better breeders than the best of these older ones on which This in we already have records. no way reduces the value of the Prov-Picardy, Commander en Parents. Koehl, Emile Auburn, Apricot Glow and others will be useful for many years. It must be realized too that the picture is never complete. New varieties are coming along every year whose progeny keeps piling up more and more with an ever-increasing number of winnings. One wonders if any variety will ever catch up with Picardy. On Jan. 1st, 1947, the writer was able to tabulate the following record: (Note: Every catalog and publication on glads has additions to this list). In the six years, 1940 to 1945 inclusive, using sources available, Picardy has won 342 first prizes, of her 21 sports, six have won 210 prizes. She is the seed parent of 240 varieties of which 96 prize winners won Among the 139 2521 first prizes. varieties of which Picardy is the pollen parent are 43 winners with This makes a grand 943 prizes. total of 4016 prizes for Picardy, her sports and her children. pendent of the above tabulation, two Dutch catalogs list 77 Picardy seedlings for introduction in the United States this year.

Correspondence will be welcomed from those wishing complete progeny lists or other information pertaining to this catalog.

Much of the foregoing information has been compiled from the NEGS Yearbooks and is used by permission of the New England Gladiolus Socity, Inc., Copyright owner.

## How New Varieties Are Born

There is no phase of flower growing more fascinating than developing new varieties. All that is needed is a keen sense of observation, a well developed curiosity, and a pair of deft hands. Of course, a yen for keeping records and a few simple tools will aid in the scientific aspects. As most gardeners are well supplied with these qualities, the only other thing needed is a knowledge of the mechanics of hybridization which are so easy they can be performed by a child.

Flowers have two essential sexual parts, the stigma and the anthers. I'he stigma is the female part. The anthers are the male parts carrying the pollen. On glads these parts in the center of every floret are quite discernable and easily distinguished from one another.

To properly cross glads one should have a supply of the small blank price tags with strings attached like those used by department stores, a pair of tweezers, s supply of small envelopes and paper bags and of course a lead pencil, soft lead preferable.

Go into the garden early on the morning the florets you intend to use first open. With the tweezers remove the anthers. If of a desired variety these can be dropped into a properly labeled envelope and used later on other specimens. Next, tie a label (price tag) to the floret loosely so as not to interfere with future growth of the seedpod. The label is applied now to aid in finding the prepared floret the next day. thoroughly accurate and scientific, a paper bag should now be tied over the floret so bees and humming birds cannot reach the stigma with unwanted pollen. Bagging is not always done as it has been found that if all but the top hood petal is cut or broken away the bees and birds seldom bother it. Many breeders merely remove the anthers, hoping that the few chance crosses may give as good or better results as their own. The stigma is seldom receptive the first day so when the desired number of florets are prepared you wait until the next day to do the actual crossing. Crosses are most successful if made during the warmer part of the day, from about noon 'till 5 o'clock, and seldom take during rainy or damp Upon returning the next weather. day, pollen of the desired variety is dusted carefully on the end of the stigma of the previously prepared floret. When properly receptive, the three tiny prongs of the stigma will be open and covered with a slightly sticky substance. Close observance will soon teach you the right time to apply the pollen. Now, write the name of the stigma or seed bearing parent followed by the name of the pollen parent on the label. If your crosses are successful, in three or four weeks there will be fat seed pods that must now be watched so that they may be harvested as soon as the pods begin to split open. Place the pods in properly labeled bags and store them in a cool dry place. When dry, clean the pod shells and the small wafer-like disks off the seed during spare time. In the spring plant the seed not over one inch deep in well prepared fertile beds, again labeling Keep well watered thruproperly. out the season as only a few hours dry will often kill the tiny seedlings once they start to grow. In sections where the weather is hot and dry a lathe shade will be found helpful. If successful, in the fall you will be able to harvest a small bulb for each seed that grew. They now require the same care as other glad bulbs. With good care many of these should bloom the second summer and you will become a confirmed "Glad Fiend."

It will be found that each seedling has developed into something different. Many may be inferior to existing varieties. The clever breeder, with luck, may be able to pick one or two good ones from several thousand seedlings. The ratio is not high, but

the thrill when you do get a good one is great.

Note: Sports are not developed from seed, but are mutations or freaks that develop in bulb division.

## Read Carefully Before Ordering

The bulbs listed are true to name, young, healthy and sure to bloom. While we make no guarantee, we do want satisfied customers and will make every effort to correct errors or misunderstanding. All prices prepaid anywhere in the U.S. will be filled and shipment made in order of rotation. All stock offered and orders accepted subject to prior sale. Right to limit number of bulbs customer of scarce items reserved. Terms: Cash with order. No mail orders for less than \$1.00 and no single item for less than 10c. Also state your preference as to whether you desire substitution or refund in case we are sold out of any of the varieties you select.

Prices are for large bulbs; no medium or small bulbs except as listed. 25 bulbs or more of one variety may be purchased at the 100 rate,

which is 8 times the 10 rate. As we have well over 1000 varieties, we probably have all your favorites even tho they are not listed, so just send your order at current prices and we'll do our best. We DO have a surplus of bulblets of some varieties. Write if interested.

EXTRAS—On orders of \$1.00 or more, we always add extra bulbs of newer varieties for trial. The larger the order the greater the value of the extras. Look for them. Note: if you would rather have overcount of the varieties you order, please state so.

If your order amounts to much more than 100 large bulbs, it is often advantageous for us to ship by express. If your mailing address is different than your express office, please list both. If you prefer Parcel Post, state so.

#### GLADVIEW SPECIALS

# NEW INTRODUCTIONS 1948

BONNEVILLE ROSE—(F. D. Daines) (Salbach's Pink x King Arthur). Due to an accidental mixup by Dr. Daines last year, very few bulbs of this variety were distributed. The Customers got Western Star instead. Therefore I am listing it as a 1948 introduction. Those few in the East who did see it have written me that they consider it one of the great glads of the decade. It is a very ruffled deep lavender rose. Probably will be classified as a 462 altho it can easily be grown large enough to go into the 562 class. It is as ruffled as its parent King Arthur but with larger, more wide open and much better

placement of florets. In color it is a bit more lavender than Miss Wisconsin. It carries sixteen buds on a twenty-two inch flower head, six open and several lovely buds in color. It produces an abundance of easy to germinate bulblets, many of them jumbos which always bloom the first year. Top awards in its color class wherever exhibited. Prices: Lge. \$4.00 each, 10 for \$32.00, Med. \$2.50 each or 10 for \$20.00, Small \$1.50 each or 10 for \$12.50. Jumbo bulblets .75 each or 10 for \$6.00. Large bulblets .50 each or 10 for \$4.00 For larger quantities write for wholesale prices.

1947

WESTERN STAR (Daines) (Sport of Picardy). Almost identical salmon pink as Picardy, but blending to a clean soft yellow throat. Entirely free of the red penciling so much in evidence in Picardy and her seedlings. For the breeder, Western Star is a "must have" as it imparts to its seedlings the identical good qualities as Picardy with the added advantage of clean throats. Western Star grows like the best Picardy stock and identical in propagation, keeping quality, etc. The late J. R. Hopkins tested, recommended and promised to introduce Western Star. This is a new glad with real promise for the Hybridist, the Exhibitor and the Commercial Grower. Prices: Lge. \$1.00 each or 10 for \$8.00, Med. .75 each or 10 for \$6.00, Small .50 each or 10 for \$4.00. Bulblets 12 for \$1.00 or \$6.00 per hundred.

**DIADEM** (Lines) This beautiful, fragrant glad in class 462 is a two-toned rose blend. Opens 6-8, lightly ruffled 5 inch florets, firmly attached to a 16-18 bud spike. Its earliness, size, beauty and large number open make it the only fragrant commercial. Fragrance is more pronounced after it has been cut a day or two. It is an excellent shipper and keeper. Field heighth 48-52 inches. Bulblet production fair, germination good. Prices: Lge. \$10.00 each, three for \$25. Med. \$7.50 each, three for \$20.00. Small \$5.00 each, three for \$12.50. Bulblets \$1.00 each, 10 for \$8.00.

1946

ODORA (Nuttall) (E. J. Shaylor x?) Classified in 341. A rather deep pure pink shading lighter on the upper petals and a large red blotch on the lower petal. Opens 6-8, 4½ inch florets on a 16 bud spike that attains a heighth of 45-48 inches in the field. Its odor or woodsy fragrance is easily perceptible which along with its good general characteristics should make it of special interest to the Hybridist as it sets seed readily. Prices: Lge. .25 each, 10 for \$2.00. Med. 2 for .25, 10 for \$1.00. Small 3 for .20, 10 for .50.

#### **EUROPEAN VARIETIES**

Many new European and Domestic varieties will be found listed in Section II which follows.

#### Section II LARGE FLOWERED PRIZE WINNERS

In Sections II and V are listed nearly every variety that was able to win 5 or more 1st prizes in United States and Canadian shows during the last two years. Many of these are also "Famous Parents." As a complete listing of the offspring of these parents would take many pages, only the noted ones are mentioned. The number following the offspring's name is the number of prizes won by this variety since 1940.

Prize	es-Name, Originator and Parentage	Date	Class	Size	Price	)
2	ABE—Ellis	1935	422	Lge. 3-	.25	1070

#### Section III

#### HYBRIDIST'S LIST OF FAMOUS PARENTS

Many of these would be listed among the winners if they were more widely known and exhibited. Many others have a long list of winnings to their credit, but are now replaced on the show bench by their progeny. Genetically these varieties may be of great value by providing short cuts to desired qualities thru back-crossing and inbreeding. Most of them are still producing fine varieties thru the usual method of outcrossing. NOTE: Back-crossing is crossing the progeny with some ancestor. Inbreeding is the crossing of brother and sister or the progeny with its immediate parent, and outcrossing is the crossing of individuals not closely related.

Name, Originator and Parentage	Date	Class	Size	Pric	е
AFLAME—Hornberger  Large very early scarlet. Parent of Br  Bronze (63), Flaming Meteor, etc.			Lge. 2-	.25	10-1.00

YELLOW FRILLS—Kunderd	1930	312	Lge. 320	1050
Ruffled and frilled bright deep yellow.			_	

### Section V

### SMALL FLOWERED WINNERS (Classes 100 and 200)

These varieties naturally produce florets of three inches or less in diameter. They are used extensively for bridal bouquets, small floral pieces, table decorations, sprays, corsages, etc. They are often called baby gladiolus. Their beauty when used alone or with other flowers is unsurpassed. Other advantages are: more spikes per bulb, more bulbs per dollar, earlier blooms from most varieties and less care as the wind never tips them over. The bulbs are smaller in some varieties than those of the large flowered glads.

# Section VII SOME FAMOUS OLD TIMERS

Because of their value for comparison, hybridizing, historical data, sentiment, etc., we have been trying for several years to obtain the names of the twenty-five best glads of each decade, and will welcome correspondence with any "fan" who can help in compiling a good list of "Old Timers" or other information along this line. We will also pay cash or trade equal value from this catalog, for any of the following: Aviatrix, Baron Hulot, Bellevue (N), Blue Jay, Capt. Boynton, California (Burbank), Chateau Thierry, Coral Bells, Europa, Eve, Herada, Highland Mary, Gold, Jane Addams, Kunderdii Glory, Lighthouse, Longfellow, Mary Fennell, Mary Pickford, Marie Kunderd, Niagara, Paisley, Pink Wonder, Princeps, Rouget de Lisle, Pythia, Queen Louise, Queen Mary, Richard Diener, Schwaben, Stately Lavender, Tangerine, Tidbit, Twin Fires, Victor (Errey), Sir Galahad (Stephens), White Giant, and the following botanicals and early hybrids: Colvillei, Concolor, Cardinalis, Gandavensis, Hirsutus, Psittacinus, Purpurea-Auratus, Recurvus, Saundersii, Tristus, Maculatus, Oppositiflorus. These must be guaranteed true to name and healthy. Preferably small or medium sizes grown from bulblets. In lots of 3 to 100 bulbs. State price, amount, size, and varieties in first letter.

We have small stocks of the following "Old Timers" to offer for sale: Name, Originator and Parentage Date Class Size Price ALICE TIPLADY—Kunderd 1915 320 Lge. 3- .20 10- .50 Saffron orange, feathered throat, early. **440** Lge. 3- .20 BREAK OF DAY-Bill 1924 10- .50 Very early light salmon pink.

### Gladiolus Culture

CARE OF BULBS

If you own or purchase bulbs in the fall, be sure they are well dried or cured before putting them into storage. Purchased bulbs should be opened on receiving and inspected, as they may mold if left tightly wrapped for any length of time. Bulbs in storage should be kept between 35 to 50 degrees F., in open trays or boxes with the bulbs piled not more than 3" or 4" deep. Be careful of frost as they are very tender. If your storage room has a dirt floor (preferable), place a couple of 2x4's under the boxes so air can freely cir-If storage is in a cement culate. basement in which your heating plant is situated, your bulbs may dry out too much, reducing their vitality or even killing them. Watch and if the husk has loosened or the cleaned bulbs crackle and rattle when handled, place a wet burlap sack near them or sprinkle them lightly with water remembering to stir them the next day so that molding will not start among the bottom bulbs in the tray. Look at your bulbs often and repeat the above treatment every week or so, if necessary.

Unless you are sure that no thrips are present on your bulbs it is well to treat them for thrips. Thrips (Taeniothrips gladioli M. and S.) is a tiny, barely visible insect. The young are cream, or light orange in color and the adult black and white. They hop and fly considerable distances, so they may attack your glads when least expected. Because one has not observed thrips in one's garden is no asurance that they will not get to your glads next summer or that

they are not already present on your bulbs in storage. Storage treatment consists of dusting cured bulbs with 5% D.D.T. powder. Leave this on the bulbs until planting time. If you have proper storage the above treatment will seldom be necessary as thrips and their eggs die if held for three months or longer at temperatures below 45 or 50 degrees.

At planting time, regardless of where your bulbs came from, give them the following treatment: soak in Lysol solution for three to six hours and plant immediately while the bulbs are still wet. This solution is insecticidal, fungicidal and a decided stimulant. If one fails to treat bulbs during the winter storage you should not miss treating them before planting.

### Formula for Lysol Solution

1 teaspoonful Lysol to 1 quart of water, or

 $1\frac{1}{4}$  tablespoonsful Lysol to 1 gallon of water, or

1 pint of Lysol to 25 gallons of water.

Solution is more effective if water is around 70 or 80 degrees F. Solution should be replaced after being used two or three times. Cresol or Cresolis Compound are similar to Lysol.

### WHEN AND WHERE TO PLANT

Successive plantings about three weeks apart should be made from the time the trees first show their leaves in the spring until the early part of July (for Provo and similar climate). Where frost comes earlier or later you can plant as long as you have 90 days before the first killing frost. At Provo glads can be bloomed during about a 100 day period from early July until October.

Glads will grow any place a garden will do well. There are a few spots in Utah where the soil is too alkaline.

Such areas should be avoided. They do best in a soil that is neutral or slightly acid, but are very tolerant to other soils. They do best in full sunshine but will bloom in partial shade. Avoid foundation or wall plantings as these situations are either too hot or too shaded.

### HOW TO PLANT

In deeply prepared soil make furrows or holes 4 to 6 inches deep, place the bulbs root end down 4 to 6 inches apart in rows two feet apart. If at the time of late plantings the soil is dry, irrigate before planting. The water may be run right down the furrow and the bulbs planted immediately after water has been shut off. Small bulbs, less than 1 inch in diameter, should be planted 3 to 4 inches deep and apart. Bulblets, the tiny fellows that are clustered in the roots, are sown thickly like peas in a furrow about two inches deep. Bulblets seldom bloom the first year but make good bulbs and blooms the second year.

## CULTIVATION, IRRIGATION AND FERTILIZATION

Glads do best if cultivated and irrigated once a week after they come up until they are in bloom. It may be difficult while they are in bloom but a good cultivation after they are through will be found very beneficial. Continue to water and care for your glads for at least a month after they are through blooming. At blooming time the new bulb that will later be dug and saved for the next year is only about the size of a thimble and is watery and immature. If for lack of water, removal of too many leaves when cutting blossoms, or any other reason growth is stopped at this stage, the bulbs will keep poorly and lack vitality the next season.

Barnyard manure is excellent if applied in the fall or early spring.

The addition of about 100 lbs. of sup- bulbs if the tops are green enough to erphosphate to each ton of manure will increase the value of both. cording to the latest information, the best Commercial fertilizer for Jtah is a 4-16-4 mixture; that is, 4% Nitrogen, 16% Phosphorous and 4% Potash or mixtures of similar proportions, applied as a side dressing after the plants are up and immediately followed by an irrigation. Successive applications may be applied with good results, providing plants are well watered after each applica-Apply 2 to 4 pounds per 100 feet of row. If more than two applications are used, less fertilizer per application is needed. NOTE: Do not let manure or other fertilizer come in direct contact with the bulb or plant, as serious injury will result.

#### SPRAYING

If allowed to, thrips may attack glads at any stage, in storage or in the field, so it is well to spray or dust the young plants as soon as they are up six to eight inches high and every two weeks thereafter until they bloom, as a preventative measure. If thrips are definitely present, spray every week.

#### Spray Formula:

D.D.T. wetable dust as per directions, or 2½% to 5% D.D.T. dusting powder.

#### DIGGING AND CURING

Six to eight weeks after the bulbs are through blooming, they should be ready for digging. Most varieties can be left longer but should be dug while there is still some green in the foliage as dormant bulbs have little or no resistance to disease or insect attack if left in the ground after growth stops. The little bulblets drop loose from the mother bulb as it ripens, thus making these much more difficult to harvest if the bulbs are left too long. It is also much easier to harvest the insure their having strength to lift the bulbs from the ground as they are loosened with a shovel or spading fork. Cut off tops close to the bulbs and place in trays or other containers. Do not pile them more than two or three bulbs deep and place tnem in a warm airy place where they will be protected from storm and frost until they are dry. If conditions are right, they should dry in two to four weeks. It is now time to clean the old roots and mummified bulb from last year off the new bulb. If cleaning is done at the right time it is much easier than if attempted too soon or late. It is best to burn this discarded material as well as the tops, as they are sources of thrips and other infestations if left on the ground. As soon as the bulbs are cleaned they are ready for winter storage.

#### CARE OF BLOOMS

As cut flowers, glads are supreme. Cut them when one or two florets are open, use a sharp knife slipping the blade down the sides of the stem to loosen the foliage if long stems are desired, then a turn of the wrist and a little pressure will sever the stem and leave the leaves with the bulb which is so necessary to produce a large healthy bulb for the next year. At least five leaves must remain on the bulb to insure its continued growth. As soon as possible after the flowers are cut place them in a deep, clean container of cold water. Each day change the water, cut about one inch off the stem and remove any wilted florets. Treated this way glads will be attractive for ten days to two weeks.

If left in the field, remove the wilted florets each day and cut out the flower head or spike when through blooming; this will cause the plant to put all its effort toward making a better bulb.
